38) The Chemical Examiner is an officer of the Sanitary dept. and the Public Health Laboratory in which he works is in charge of the Sanitary Commr. But the report of the Chemical Examiner is first submitted and through the Surgeon and not the Sanitary Commr. and the Chemical Examiner is supposed to work under the administrative control of the Surgeon. This is an anomaly and is a relic of the bygone days when the Surgeon was the head of both the Medical and Sanitary depts. The Surgeon was asked to furnish his opinion as to why the present practice did not be discontinued & the Chemical Examiner placed entirely under the control of the Sanitary Commr. The Surgeon & the special superior of the Chemical Examiner are both of opinion that the present administrative control works well. But

NOTE—Contn. sheet.

Final Note by the Third Member of Council.

(16

Subject:- 52)

Question of placing the Chemical Examiner under the sole control of the Sanitary Commissioner.

The Chemical Examiner to the Government of Mysore who is also an Assistant to the Director of Public Health Institute is at present under the administrative control of the Senior Surgeon in his former capacity and under the Sanitary Commissioner in his capacity as Assistant Director. In consequence of this arrangement, he submits his Chemical and Bacteriological Report to Government through the Sanitary Commissioner and the Toxicological Report through the Senior Surgeon. As this involved dual control it appeared desirable to change the existing practice and place the Chemical Examiner under the administrative control of the Sanitary Commissioner only, in view of the fact that he is an officer of the Public Health Institute of which the Sanitary Commissioner is the Director.

2. The opinion of the Senior Surgeon as well as of the Sanitary Commissioner was called for in the matter. The Sanitary Commissioner was of course in favour of doing away with the present system, but the Senior Surgeon relied upon the Madras practice and stated that the present arrangement should continue.

3. But the conditions here are quite different from those in Madras. There the Chemical Examiner is an officer of the Medical Department and he has a separate laboratory of his own. But here the Chemical Examiner is an officer of the Sanitary Department and the Public Health Laboratory in which he works is in charge of the Sanitary Commissioner. The present practice is a relic of the by-gone days when the Senior Surgeon was the Head of both the Medical and Sanitary Department and I

therefore

(17

Pages 12, 13 of Office Notes

therefore proposed that the present system might be done away with and the Chemical Examiner made directly subordinate to the Sanitary Commissioner instead of to the Senior Surgeon as heretofore.

5. The matter was considered at a meeting of the Council and it was resolved that the Chemical Examiner might be placed under the administrative control of the Sanitary Commissioner.

Page 14 of do

6. The Resolution of the Council may be graciously approved.

Office of the
Director, Public Health Institute,

Dated, Bangalore the 14th July 1919.

From

Dr. A.K. Pani, L.M.S., L.R.C.P.S., D.P.H.,
Director of the Public Health Institute, Bangalore.

To

C.S. Balasundaram Iyer, Esquire, B.A.,
Chief Secretary to the Government of His
Highness the Maharaja of Mysore, Bangalore.

Sir,

I have the honor to forward my report on the Chemical and Bacteriological work in 1918.

Chemical - 152 articles were received for analysis from various Departments of Government and 4 fee from private persons as detailed below against 176 in 1917; the falling off is noticeable under samples of urine.

Sl. No.	Articles.	Total No.	Government Departments or from whom.	Remarks.
1.	Water.	26	Chief Engineer for Irrigation, Districts and state Railway.	
2.	Alum.	16	Water Supply Department.	
3.	Drugs.	28	Medical Stores.	
4.	Opium, ganja etc	14	Excise.	
5.	Food-stuffs.	12	Palace, Districts and Central College Hostel.	
6.	Soaps.	3	Government Soap Factory and the Vaccine Institute.	
7.	Inks.	6	Director of Industries and Superintendent, Government Press, Bangalore.	Including 1 from private persons.
8.	Urine.	45	Government Institutions and officials.	Including 6 from private persons.
9.	Miscellaneous.	2	Sanitary Commissioner and Superintendent, Botanical Gardens.	

(1) Water - 26 samples were received. Of these 24 were for portability; 10 were found fit for human consumption and 14 unfit. There were 2 for locomotive purposes. 1 was found fit and the other was condemned.

(2) Alum - 16 samples were received for examination of alumina content and fitness for filtration purposes. All were found tolerably good.

(3) Drugs - 28 articles consisting of tinctures, oils, ointments etc., were received, of which 14 only were found to correspond with the B.P. standard.

(4) Excise articles - 14 were received consisting of opium 3, ganja 2, fermented drink from rice 4, essences for preparing artificial liquors 3 and caoutchoucine for denaturing rectified spirit 2.

(5) Food stuffs - There were 12 articles. 2 samples of ghee, 1 from the Central College Hostel and the other from a District. Both were found adulterated. 6 samples of milk of cows of different breeds were received from the Palace for comparison of quality and similarly 4 samples of almond oil from the Palace.

(6) Soaps - There were 3 samples; 2 of them from the Government Soap Factory. They were found to be of very good quality. One was from the Vaccine Institute to find out if it had any antiseptic property and if it contained free lime. Results were negative.

(7) Inks - There were 6 samples; 3 from the Director of Industries of which two were good; 2 from the Government Press of which 1 was good and the remaining one from a private person.

(8) Urine - 45 samples were received for examination for albumen, sugar etc.

(9) Miscellaneous - There were 2 articles. One was a remedy for Influenza from the Sanitary Commissioner and the other a suspected poisoning from the Superintendent, Botanical Gardens.

(25

Gardens.

Bacteriological - 2652 examinations were made against 3358 in 1917. They were composed of 1255 samples of water, 1302 of blood, 58 of discharges, 2 of dead animals, 2 of pathological tissues, 7 of vaccines and 6 miscellaneous.

(1) Water - 362 were examined quantitively to find out the number of bacteria per cubic centimeter with a view to test the efficiency of filters. The results on the whole were satisfactory. 431 were examined for presence of lactose fermenters, which were found invariably always in quantities of less than 50 c.c. A few lactose fermenters in drinking water do no harm, but their presence indicates faecal contamination. In a good filtered water, they should not be found in quantities less than 50 c.c. It shows therefore, that filters, though capable of checking effectively passage of extraneous bacteria do not exercise the same control on lactose fermenters. Tap waters sent by the Health Officer, Bangalore City, were almost always worse in quality in this respect than the Hesserghatta filtered water. 462 samples were examined for Cholera vibrios which were found in 13 of them.

(2) Blood - 178 were tested for reaction of agglutination with enteric bacillus, which was found positive in 65 and negative in 113. One hundred and seventy seven were tested with bacillus paratyphoid A and B each, which yielded positive reaction in 61 and 31 respectively and negative in the rest. 162 tested with bacillus columbense gave positive reaction in 39 and negative 123. 578 samples were received for application of Wasserman's reaction for diagnosis of syphilis, and in 198 it gave positive results. 24 samples were received for examination for malarial parasites, which were found in 5 of them only. 3 samples of blood were stained and examined for differential count of leucocytes. Leishman Donovan bodies for diagnosis of Kala Azar were looked for in 2 samples but were not found. In 1 sample tubercle bacilli were searched for but

but not found.

(3) Sputum, discharges etc:- 58 samples were received of which 28 were of sputa, 16 of faecal matter, 2 of vomitted matter, 7 of urine, 4 of vaginal discharges, and 1 of pus. Of the 28 samples of sputum, 27 were examined for bacillus tuberculosis and 1 for pneumococcus. Bacillus tuberculosis was found in 6 samples only and pneumococcus was not found. Of the 16 samples of faecal matter, 2 were examined for tubercle bacillus, which was found in 1; 5 for vibrio cholera which was found in 1; 2 for typhoid bacillus, which was found in none; 3 for amoeba hystalitica, which was found in 1; and 3 for ova and parasites, which were found in 1. Of the 7 samples of urine, 1 was for tubercle bacillus, 1 for bacillus coli and 5 for ova of bilharzia haematobia. Tubercle bacillus was not found; but bacillus coli was found in 1 and ova of bilharzia haematobia in 2. Of the 2 samples of vomitted matter examined for cholera vibrio, none were found in either. Of the 4 samples of vaginal discharges, 3 were for gonococcus and 1 for tubercle bacillus, but neither was found. The one sample of pus that was examined for tubercle bacillus yielded negative results.

(4) Dead animals - 24 comprising dead guinea pigs, rats and sheep were received for examination. Bacillus Pestis was found in 4 dead rats only.

(5) Pathological specimens of tumours etc - 2 specimens were cut into sections and examined. One was malignant and the other benign in nature.

(6) Vaccines - 7 autovaccines were prepared. Four for staphylococcal, 1 streptococcal, 1 Bacillus Pyocyaneus and 1 micrococcus catarrhalisinfection.

(7) There were 6 samples. Of these, three were of sand sent for examination for presence of bacillus coli, which was found in 2 of them. The remaining three were samples of disinfectants received for finding out their germicidal value.

(47

value.

The sixth session of the School of Hygiene began on the 1st July 1918. Fifteen students were trained for the Diploma of Sanitary Inspectors. Nine of them paid the usual fees and six were admitted as free students on the recommendations of the Deputy Commissioners of Districts. At the Examination conducted in January 1919, twenty candidates in all appeared including 6 old students. Of these, 11 were declared to have passed all in the second class.

To -

The Chief Secretary to the Government of
H. H. the Maharaja of Mysore,
~~Department.~~ Bangalore.

Sir,

I have the honor to forward herewith the report on the Toxicological work done by the Chemical Examiner during the Calendar Year 1918, received from the Chemical Examiner who makes certain suggestions, which are dealt with below.

Articles seized in cases of murder and rape are not likely to get more dirty in their transmission from the Police to the Chemical Examiner as they are securely packed and sealed. It is likely that the articles will be dirty when they come to the possession of the Police who cannot be expected to be able to pick out the particular stains that would give the required result. It seems best to leave the selection of the stains to the ~~experienced and unbiased~~ Chemical Examiner.

The suggestion regarding the issue of instructions regarding intimation to the Chemical Examiner of the particular kinds of suspected poisons for which alone an examination has to be made by the officer is also impracticable.

I have the honor to be,

Sir,

Your most obedient servant,

T V Armugam

Senior Surgeon.

Reg. sent to Statistical Branch Today

5/8/18

Letter No. 249 dated 28-4-1919, from the Chemical Examiner to the Government of Mysore, Bangalore, to the Senior Surgeon in Mysore Bangalore

---

I have the honor to forward my report on the toxicological work for the Calendar Year 1918.

1) 154 cases with 529 articles were received for examination against 126 cases and 387 articles in 1917. In 108 of these cases, poisons etc., were detected, giving a per centage of 70.1 against 61.1 last year.

2) The cases are classfied below under different heads. with results:-

(1) Suspected human poisoning:- 54 cases. In 19, i.e., 35 per cent, poisons were detected. Arsenic was found in 15; mercury perchloride in 3 and opium in 1.

(2) Abortion:- 3 cases- no poison was detected.

(3) Cattle poisoning:- 3 cases. Arsenic was detected in 1, i.e., 33.3 per cent.

(4) Blood and seminal stains in cases of rape murder etc., :- 65 cases. Mammalian blood was detected in 73 and spermatazoa in 6, i.e, 92.9 per cent.

(5) Miscellaneous:- 8 cases. In 4 cases of food grains, 2 were condemned and 2 were found fit for human consumption. There were 6 samples of whisky. All were found adulterated. 1 sample of ghee received was found free from poison. 1 sample of opium received was found fit for human consumption under medical advice. There was a case of suspected bomb explosion. Only sulphur was detected in it.

4) In cases of murder and rape, suspected articles seized by the Police are usually so dirty that the stains are marked and are found extremely difficult to trace. It is just likely a few may have been missed. When fresh, they can be easily detected. If distinguishing marks, or tracing with ink or coloured pencil, be made round them immediately the articles are taken possession of, it will simplify examination.

5) In cases of suspected poisoning, occasionally no clue is given

given as to the nature of the poison suspected. In such cases, difficulty of examination can be imagined when it is known that there are hundreds of poisons and the ~~xxxx~~ material for examination, that could be supplied is comparatively very little. Some instructions from the Government to various departments concerned are therefore solicited.

Tabular statement for 1918

Sir,

With reference to your letter No.G.5370-San.14-19-5, dated 2nd September 1919, I have the honor to state that from the report of the Chemical Examiner, the only details of the so-called "bomb explosion" case are contained in the enclosed copy of letter No.173, dated 13th September 1918 from the District Superintendent of Police, Tumkur, to the Inspector General of Police in Mysore. It is further reported that stained pieces of glass and tin were sent for analysis in connection with the case and that sulphur was detected in the stains and nothing in the tin pieces.

(37)

Copy of letter No. 173, dated 13/14th September 1919, from the District Superintendent of Police, Tumkur District, to Inspector-General of Police in Mysore, Bangalore .

I have the honor to state for your information that C.S. Thimmiah, Proprietor of the B.I. Dramatic Company, stated before the Kasaba Jamedar, Tiptur Taluk at 10-30 P.M., on 10-9-18, that while he was about to stage the play of the Kalidasa in Veerabhadragowdas Choultry at Tiptur that night, Town Daffedar Sidda Nanjah came there and demanded him to show the license and thereupon he took him out stating that he would take him to the Police Inspector to whom the license had been referred by the Amildar Magistrate and that he then asked his servant Thimmah to light the Huricane lamp and bring it out as it was dark and that immediately he went out, he heard a sound as if from an explosion and on going to the stage, he found broken pieces of glass and about 33 metal pieces found scattered on the floor. The glass of the huricane lamp has been broken into pieces but the metallic portion (reservoir etc., were intact and undamaged) but only some sort of sulphur fumes etc., seemed to have adhered to the bottom of the metallic reservoir of the huricane lantern. The case had been taken on file by the Police Inspector under Section 324 I.P.C., but as per orders issued from this office Section 286 has also been added Thimma, Sanga and Ranga, 3 persons of the troupe have received injuries but none appears to be likely to turn fatal. The huricane lantern broken pieces of glass and the metallic pieces have been sent to the Chemical Examiner for analysis and opinion as to the explosives contained therein . A reference has also been made to the Inspector of Explosives in this matter. Further report will be made after a detailed enquiry into the matter.

A Bioscope performance was going on in the adjacent building at the same time . Whether the explosion was caused intentionally or not is being investigated .This special report is submitted as it is an unusal occurence.

2) The marginally noted Communications from the Sany. Comr & the Sr Surgeon in the matter of submission of the Chemical Examiner to Govt, of annual reports on Toxicological work done by him through the Sany. Comr instead of through the Senior Surgeon as at present

Order No

Under the arrangement ordered in G.O. dt/10. Nov. 1911 read above, the Chemical Examiner to Govt who is also an Asst. to the Dir. of the Public Health Institute, is under the control

52

of the Senior Surgeon in his former capacity and under the Sanit. Comr in the latter capacity.

In consequence of this arrangement which was ordered at a time when the Senior Surgeon was the Head of both the Med & Sanit. Depts, the Chemical & Bacteriological report is being submitted to Govt through the Sanit. Comr & the Zoological report through the Senior Surgeon

2. In view of the fact that the Chemical Examiner in Ispore is an offr of the Public Health Institute, of which the Sanit. Comr is the Director, Govt consider that the existing practice which involves dual control ~~is no longer necessary~~ might be discontinued and are accordingly pleased to direct that the Chemical Examiner be placed in future solely under the administrative control of the Sanit. Comr.

Read—

Para 2 of Government Order No. 3525-7—San. 132-10-6, dated 10th November 1911, placing Dr. M. Srinivasa Rao, Superintendent of Public Health Institute and Chemical Examiner to Government under the orders of the Sanitary Commissioner in matters connected with the Health Institute, and under the orders of the Senior Surgeon in matters relating to Forendic Medicine.

2. The marginally noted communications from the Sanitary Commissioner and the Senior Surgeon in the matter of submission by the Chemical Examiner to Government, of annual reports on Toxicological work done by him through the Sanitary Commissioner instead of through the Senior Surgeon as at present.

No. G. C 184-2, dated 27th December 1919, from the Sanitary Commissioner.
No. G. C. 227-2, dated 13th March 1920, from the Senior Surgeon.

Order No. G. 3035-6—San. 14-19-15, dated 6th August 1920.

Under the arrangement ordered, in Government Order dated 10th November 1911 read above, the Chemical Examiner in Mysore, who is also an Assistant to the Director of the Public Health Institute, is under the control of the Senior Surgeon in his former capacity and under the Sanitary Commissioner in the latter capacity. In consequence of this arrangement which was ordered at a time when the Senior Surgeon was the Head of both the Medical and Sanitary Departments, the Chemical and Bacteriological report is being submitted to Government through the Sanitary Commissioner and the Toxicological report through the Senior Surgeon.

2. In view of the fact that the Chemical Examiner in Mysore is an Officer of the Public Health Institute, of which the Sanitary Commissioner is the Director, Government consider that the existing practice which involves dual control might be discontinued and they are accordingly pleased to direct that the Chemical Examiner be placed in future solely under the administrative control of the Sanitary Commissioner.

C. S. BALASUNDARAM IYER,
Chief Secretary to Government.

To—The Senior Surgeon in Mysore.
The Sanitary Commissioner in Mysore.
